Week 2 - Problem Statement

Write a Java Program using notepad/notepad++ that will print how many days a month contains (Consider year 2018 for February). If the input is not a correct month, it will print that the input is incorrect.

Sample Input:

```
january
```

Sample Output:

```
january has 31 days.
```

- You must keep the name of the months in array.
- You cannot use an IDE for this task

Bonus: Take input from command line instead of console.
